# 1. INTRODUCTION

## 1.1 Project Overview

The Liver Patient Identification – prediction of Liver diseases represents a significant public health challenge, impacting millions of individuals worldwide. Conditions such as hepatitis, cirrhosis, and liver cancer can lead to severe complications and mortality if not identified and managed early. The liver plays a crucial role in various bodily functions, including metabolism, detoxification, and production of essential proteins. As such, the timely identification of liver diseases is vital for effective treatment and improved patient outcomes.

This project aims to develop a comprehensive Liver Patient Identification System that leverages clinical data, laboratory results, and imaging studies to accurately identify individuals at risk for liver diseases. By utilizing advanced data analysis techniques and machine learning algorithms, the project seeks to enhance the early detection of liver conditions, ultimately leading to better management strategies and improved health outcomes for patients.

## 1.2 Objectives

**The main objectives of this project are:**

- **Early Detection:** To develop a system that enables the early identification of patients at risk for liver diseases, thereby facilitating timely intervention and treatment.
- **Risk Assessment:** To implement algorithms that assess individual risk factors for liver diseases, helping healthcare providers identify high-risk patients more effectively.
- **Improved Patient Outcomes:** To enhance patient management strategies through accurate identification, leading to better health outcomes and reduced morbidity associated with liver diseases.
- **Collaboration with Healthcare Providers:** To work closely with healthcare professionals to ensure the system meets clinical needs and can be seamlessly integrated into existing workflows.
- **Education and Awareness:** To raise awareness about liver diseases and the importance of early identification among both healthcare providers and the general public.

- **Research Contribution:** To contribute to the body of knowledge regarding liver diseases by analysing patterns and trends in the identified patient population.

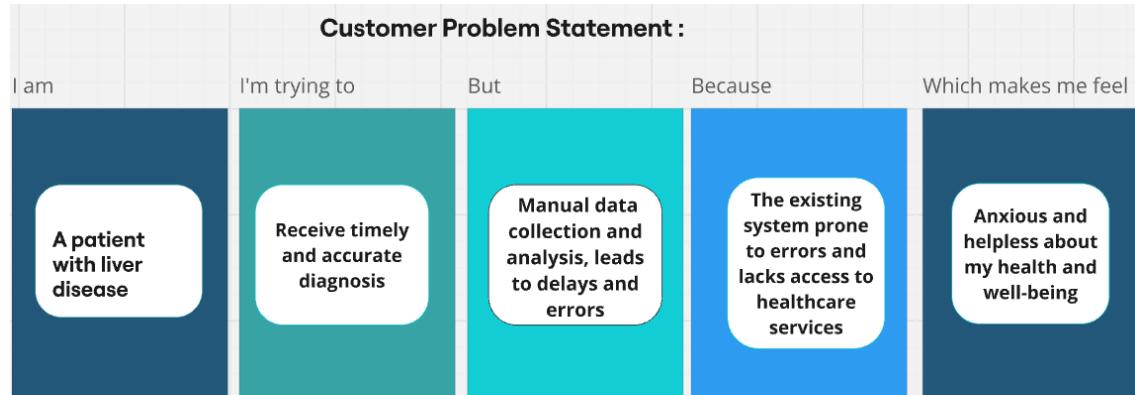

## 2. Project Initialization and Planning Phase

### 2.1 Define Problem Statement

Date	03-10-2024
Team ID	LTVIP2024TMID24892
Project Name	Liver Patient Identification – prediction of liver disease
Maximum Marks	3 Marks

#### Define Problem Statements (Customer Problem Statement Template):

The current system for liver patient identification is often inadequate, leading to delayed diagnosis and poor health outcomes. Many patients with liver disease are not diagnosed until they exhibit symptoms of end-stage decompensation, which can be fatal. The current system relies heavily on manual data collection and analysis, which can be time-consuming and prone to errors. Many patients with liver disease do not have access to healthcare services, making it difficult for them to receive timely diagnosis and treatment.

<b>Problem Statement (PS)</b>	<b>I am (Customer)</b>	<b>I'm trying to</b>	<b>But</b>	<b>Because</b>	<b>Which makes me feel</b>
PS-1	A healthcare provider	Identify liver patients in a timely manner	The current system relies on manual data collection and analysis, leading to delays and errors	The existing system is inadequate and inefficient	Concerned about the well-being of my patients
PS-2	A patient with liver disease	Receive timely and accurate diagnosis and treatment	Manual data collection and analysis, leading to delays and errors	The existing system is prone to errors and lacks access to healthcare services	Anxious and helpless about my health and well-being

## **2.2 Project Proposal (Proposed Solution):**

Date	03-10-2024
Team ID	LTVIP2024TMID24892
Project Title	Liver Patient Identification – prediction of liver disease
Maximum Marks	3 Marks

### **Project Proposal (Proposed Solution) Report:**

The system we are proposing utilize various machine learning algorithms and techniques to identify liver patients. This system includes a machine learning-based approach for liver disease diagnosis using clinical and laboratory feature. A machine learning-based approach for liver disease diagnosis using clinical and laboratory features involves training machine learning algorithms on large datasets of clinical and laboratory features to identify patterns and relationships that can predict liver. By using this model we can predict which patient has liver disease accurately.

<b>Project Overview</b>	
Objective	Identifying whether a person has a liver disease or not.
Scope	This project can identify the liver patient based on the clinical reports.
<b>Problem Statement</b>	
Description	Many patients with liver disease are not diagnosed until they exhibit symptoms of end-stage de compensation, which can be fatal. The current system relies heavily on manual data collection and analysis, which can be time-consuming and prone to errors.

Impact	<p>It can be time-consuming and prone to errors. Many patients with liver disease do not have access to healthcare services, making it difficult for them to receive timely diagnosis and treatment.</p>
<b>Proposed Solution</b>	
Approach	<p>The system we are proposing utilize various machine learning algorithms and techniques to identify liver patients. This system includes a machine learning-based approach for liver disease diagnosis using clinical and laboratory feature.</p>
Key Features	<p>By using this model we can predict which patient has liver disease accurately.</p> <ul style="list-style-type: none"> <li>11. Low cost</li> <li>12. Less time consuming</li> <li>13. Timely diagnosis</li> </ul>

### **Resource Requirements:**

Resource Type	Description	Specification/Allocation
<b>Hardware</b>		
Computing Resources	CPU/GPU specifications, number of cores	e.g., 2 x NVIDIA V100 GPUs
Memory	RAM specifications	e.g., 8 GB
Storage	Disk space for data, models, and logs	e.g., 1 TB SSD
<b>Software</b>		
Frameworks	Python frameworks	e.g., Flask

Libraries	Additional libraries	e.g., scikit-learn, pandas, numpy
Development Environment	IDE, version control	e.g., Jupyter Notebook, Git
<b>Data</b>		
Data	Source, size, format	e.g., Kaggle dataset , 584 reports, CSV

## 2.3 Initial Project Planning

Date	28-09-2024
Team ID	LTVIP2024TMID24892
Project Name	Liver Patient Identification – prediction of liver disease
Maximum Marks	4 Marks

### Product Backlog, Sprint Schedule, and Estimation:

Sprint	Functional Requirement (Epic)	User Story Number	User Story / Task	Story Points	Priority	Team Members	Start Date
Sprint-1	Data Collection and Preprocessing	USN-1	Understanding & loading data	1	Low	Suchendra	2024-09-28
Sprint-1	Data Collection and Preprocessing	USN-2	Data cleaning	1	Medium	Subash	2024-09-28
Sprint-2	Data Collection and Preprocessing	USN-3	EDA	2	High	Mohan	2024-10-12

Sprint-3	Model Development	USN-4	Training the model	2	High	Venkatesh	2024
Sprint-3	Model tuning and testing	USN-5	Model tuning	1	High	Subash, Sandeep	2024
Sprint-4	Web integration and Deployment	USN-6	Building HTML templates	2	Medium	Sandeep	2024
Sprint-5	Web integration and Deployment	USN-7	Deployment	2	High	Venkatesh	2024

### **3.Data Collection and Preprocessing Phase**

#### **3.1. Data Collection Plan and Raw Data Sources Identified**

Date	03-10-2024
Team ID	LTVIP2024TMID24892
Project Title	Liver Patient Identification – prediction of liver patient
Maximum Marks	2 Marks

#### **Data Collection Plan & Raw Data Sources Identification:**

A data collection plan for liver patient identification involves gathering relevant data from various sources to identify potential liver patients. Raw data sources can include medical claims data, laboratory results. Additionally, data from wearable devices, mobile apps, and patient-reported outcomes can also be used. The data collection plan should ensure that the data is accurate, complete, and relevant to the research question.

#### **Data Collection Plan:**

Section	Description
Project Overview	The objective of this machine learning project is to identify the persons who have liver disease based on the laboratories records.
Data Collection Plan	The data will be searched from the kaggle and other websites and indian liver patient websites.

Raw Data Sources Identified	The dataset has been collected from kaggle and from indian liver patient website.
-----------------------------	---

### Raw Data Sources Report:

Source Name	Description	Location/URL	Format	Size	Access Permissions
<b>ILPD (Indian Liver Patient Dataset)</b>	The Indian Liver Patient Dataset (ILPD) is a valuable collection of medical records that includes 583 entries. It features ten key attributes age and gender, as well as crucial laboratory measurements such as total bilirubin, alkaline phosphatase.	<a href="https://archive.ics.uci.edu/dataset/225/ilpd+indian+liver+patient+dataset">https://archive.ics.uci.edu/dataset/225/ilpd+indian+liver+patient+dataset</a>	CSV	23.4 KB	Public
Kaggle dataset	This dataset also contains the same common values as	<a href="https://www.kaggle.com/datasets/abhi923shriv/liver-disease-patient-dataset">https://www.kaggle.com/datasets/abhi923shriv/liver-disease-patient-dataset</a>	CSV	1.2 MB	Public

### **3.2. Data Quality Report**

Date	03-10-2024
Team ID	LTVIP2024TMID24892
Project Title	Liver Patient Identification – prediction of liver patient
Maximum Marks	2 Marks

#### **Data Quality Report:**

The Data Quality Report Template will summarize data quality issues from the selected source, including severity levels and resolution plans. It will aid in systematically identifying and rectifying data discrepancies.

<b>Data Source</b>	<b>Data Quality Issue</b>	<b>Severity</b>	<b>Resolution Plan</b>
Kaggle Dataset	Missing values are in the ['Albumin_and_Globulin_Ratio']	Low	Used mean/median imputation.
Kaggle Dataset	Categorical data in the dataset	Moderate	There is no need of Standardization and Normalization for the dataset, as we have used Ensemble Technique.

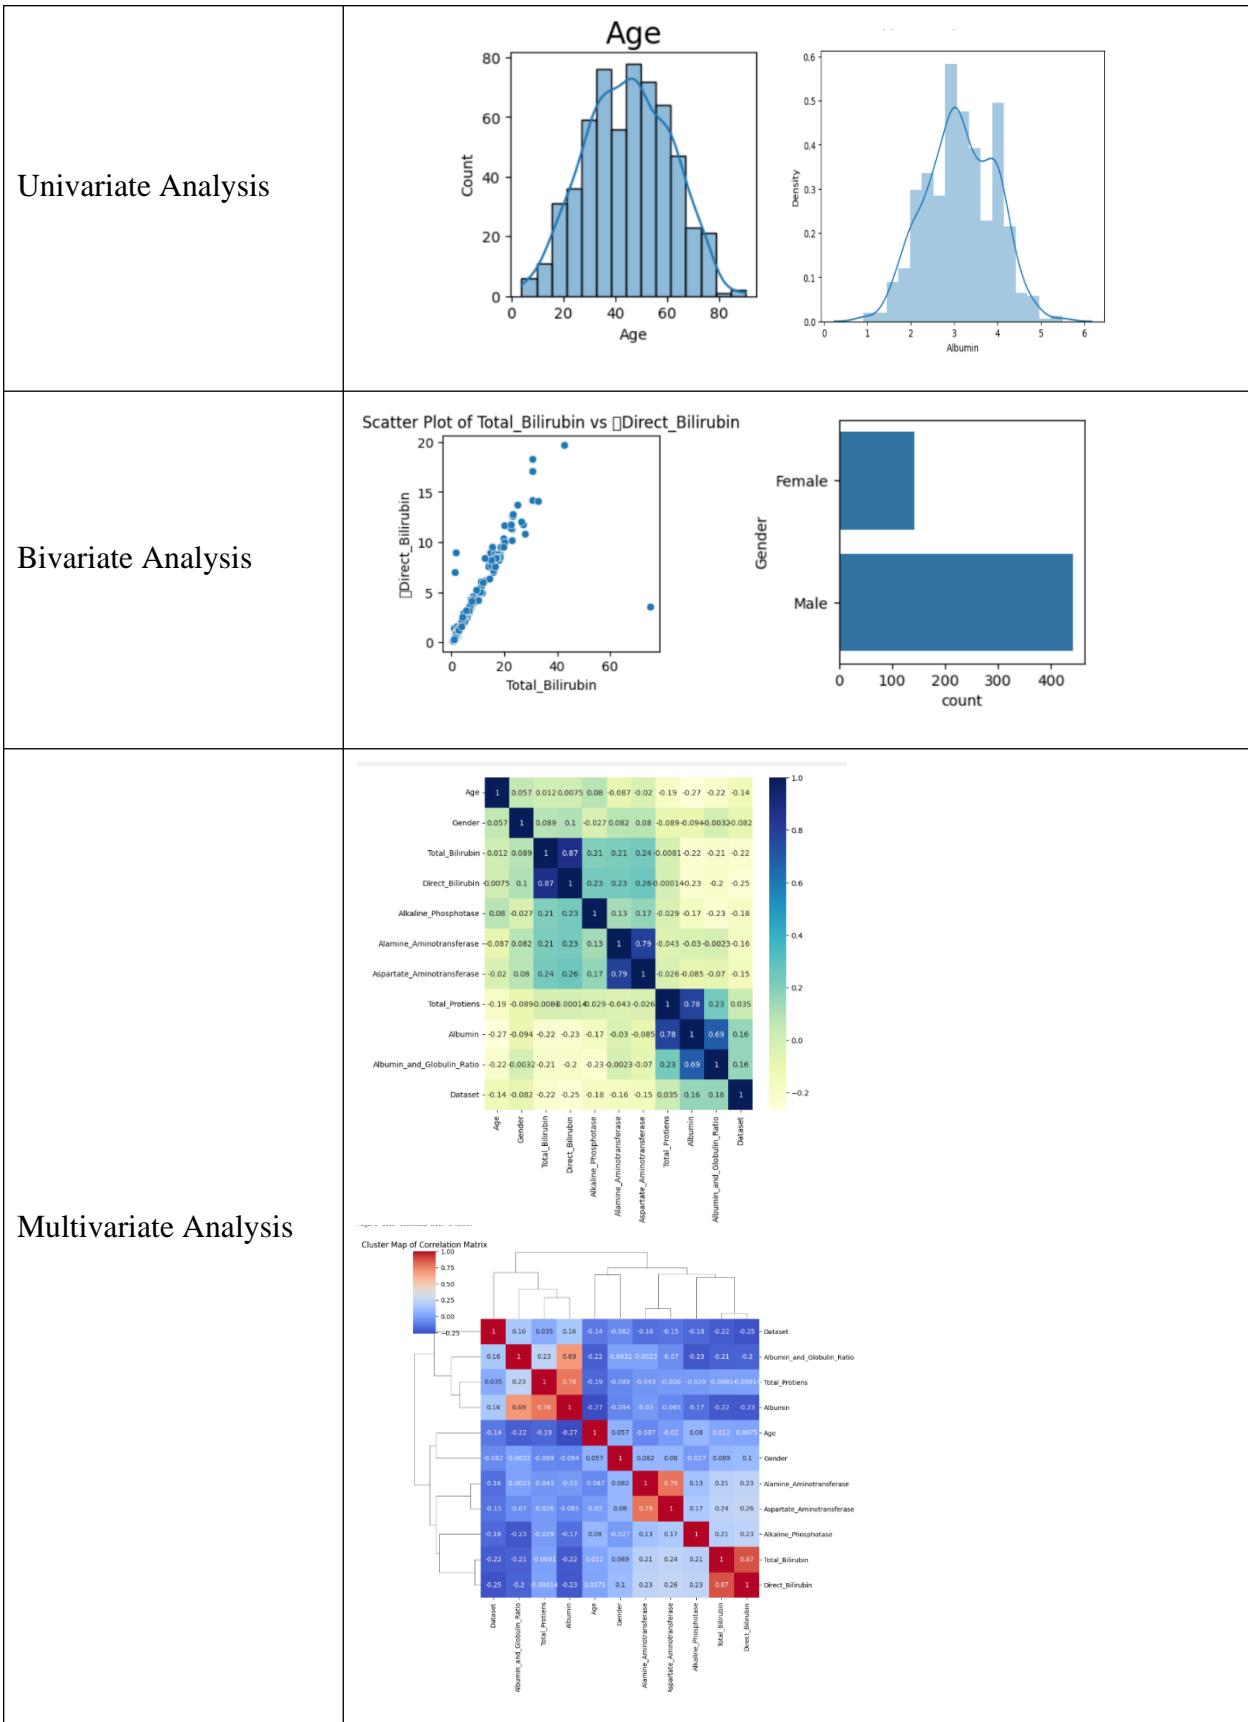

### 3.3. Data Collection and Preprocessing Phase

Date	03-10-2024
Team ID	LTVIP2024TMID24892
Project Title	Liver Patient Identification – prediction of liver patient
Maximum Marks	6 Marks

#### Data Exploration and Preprocessing Report

Dataset variables will be statistically analyzed to identify patterns and outliers, with Python employed for preprocessing tasks like normalization and feature engineering. Data cleaning will address missing values and outliers, ensuring quality for subsequent analysis and modelling, and forming a strong foundation for insights and predictions.

## Outliers and Anomalies

```
# Calculate the boundaries of Total_Protiens feature which differentiates the outliers:  
upper_boundary=df['Total_Protiens'].mean() + 3* df['Total_Protiens'].std()  
lower_boundary=df['Total_Protiens'].mean() - 3* df['Total_Protiens'].std()  
  
print(df['Total_Protiens'].mean())  
print(lower_boundary)  
print(upper_boundary)  
  
6.483190394511149  
3.22683594244075  
9.739544846581548
```

## Data Preprocessing Code Screenshots

### Loading Data

```
# Reading Dataset:  
df = pd.read_csv("./content/Liver_data.csv")  
# Top 5 records:  
df.head()
```

	Age	Gender	Total_Bilirubin	Direct_Bilirubin	Alkaline_Phosphotase	Alamine_Aminotransferase	Aspartate_Aminotransferase
0	65	Female	0.7	0.1	187	16	18
1	62	Male	10.9	5.5	699	64	100
2	62	Male	7.3	4.1	490	60	68
3	58	Male	1.0	0.4	182	14	20
4	72	Male	3.9	2.0	195	27	59

### Handling Missing Data

```
# Mean & Median of "Albumin_and_Globulin_Ratio" feature:  
print(df['Albumin_and_Globulin_Ratio'].median())  
print(df['Albumin_and_Globulin_Ratio'].mean())  
  
0.93  
0.9470639032815197  
  
# Filling NaN Values of "Albumin_and_Globulin_Ratio" feature with Median :  
df['Albumin_and_Globulin_Ratio'] = df['Albumin_and_Globulin_Ratio'].fillna(df['Albumin_and_Globulin_Ratio'].median())
```

### Data Transformation

There is no need of Standardization and Normalization of our dataset, as we using Ensemble Technique.

### Feature Engineering

```
# SMOTE Technique:  
from imblearn.combine import SMOTETomek  
num_bins = 3  
y = pd.cut(y, bins=num_bins, labels=False)  
  
smote = SMOTETomek()  
X_smote, y_smote = smote.fit_resample(X, y)  
  
# Counting before and after SMOTE:  
from collections import Counter  
print('Before SMOTE : ', Counter(y))  
print('After SMOTE  : ', Counter(y_smote))  
  
Before SMOTE :  Counter({0: 416, 2: 167})  
After SMOTE  :  Counter({0: 394, 2: 394})
```

## 4. Model Development Phase

### 4.1. Feature Selection Report

Date	03-10-2024
Team ID	LTVIP2024TMID24892
Project Title	Liver Patient Identification – prediction of liver patient
Maximum Marks	5 Marks

#### Feature Selection Report:

Feature selection plays a important role in Improves Model Performance, Reduces Training Time, Increases Model Interpretability, Facilitates Better Data Understanding.

Feature	Description	Selected (Yes/No)	Reasoning
Age	Age is an important factor in liver disease diagnosis.	Yes	Liver disease can affect people of different ages.
Total Bilirubin	Total bilirubin is a key indicator of liver function.	Yes	Elevated levels can indicate liver disease.

Direct Bilirubin	Direct bilirubin is a specific type of bilirubin that is directly conjugated with glucuronic acid.	No	Elevated levels can indicate liver disease but not accurately.
Alkaline Phosphatase	Alkaline phosphatase is an enzyme that is elevated in liver disease	Yes	This feature can be used as a diagnostic marker.
Gender	Male or Female	Yes	-
Total Protein	Can be used to indicate liver disease	Yes	Elevated levels can indicate liver disease.
Alanine Aminotransferase	Alanine aminotransferase is an enzyme that is elevated in liver disease	Yes	This feature can be used as a diagnostic marker.

## 4.2 Model Selection Report

Date	03-10-2024
Team ID	LTVIP2024TMID24892
Project Title	Liver Patient Identification – prediction of liver patient
Maximum Marks	6 Marks

### Model Selection Report

In the forthcoming Model Selection Report, various models will be outlined, detailing their descriptions, hyperparameters, and performance metrics, including Accuracy or F1 Score. This comprehensive report will provide insights into the chosen models and their effectiveness.

#### Model Selection Report:

Model	Description	Hyperparameters	Performance Metric (e.g., Accuracy, F1 Score)
Random forest	Random Forest can be effectively used in a liver patient identification model to improve diagnosis accuracy, reduce costs, and enhance patient	14. n_estimators 15. criterion 16. max_depth 17. min_samples_split 18. min_samples_leaf	Accuracy = 84%

	outcomes.		
SVM	SVMs can handle high-dimensional data with ease, improving model performance. This is particularly useful in liver patient data, which often involves a large number of features	19. Kernel 20. C 21. Gama	Accuracy = 73%
KNN	KNN can handle high-dimensional data with ease, reducing the curse of dimensionality and improving model performance.	1. n_neighbour 2. weights 3. P	Accuracy = 76%

#### 4.3 Initial Model Training Code, Model Validation and Evaluation Report

Date	03-10-2024
Team ID	LTVIP2024TMID24892
Project Title	Liver Patient Identification – prediction of liver patient
Maximum Marks	4 Marks

#### Initial Model Training Code, Model Validation and Evaluation Report

The initial model training code will be showcased in this. The model validation and evaluation report will include classification reports, accuracy, and confusion matrices for multiple models, presented through respective screenshots.

#### Initial Model Training Code:

##### Train Test split for all models:

```
# Train Test Split:  
from sklearn.model_selection import train_test_split  
X_train,X_test,y_train,y_test = train_test_split(X_smote,y_smote, test_size=0.2, random_state=42)
```

##### Random forest model

```
# RandomForestClassifier:  
from sklearn.ensemble import RandomForestClassifier  
RandomForest = RandomForestClassifier()  
RandomForest = RandomForest.fit(X_train,y_train)  
  
# Predictions:  
y_pred = RandomForest.predict(X_test)  
  
# Performance:  
print('Accuracy:', accuracy_score(y_test,y_pred))  
print(classification_report(y_test,y_pred))
```

## KNN Model:

```
#kNearest Neighbours
from sklearn.neighbors import KNeighborsClassifier
kneighbours = KNeighborsClassifier()
kneighbours = kneighbours.fit(X_train,y_train)

# Predictions:
y_pred = kneighbours.predict(X_test)
|
# Performance:
print('Accuracy:', accuracy_score(y_test,y_pred))
print(classification_report(y_test,y_pred))
```

## Support vector Machine Model:

```
#kNearest Neighbours
from sklearn.neighbors import KNeighborsClassifier
kneighbours = KNeighborsClassifier()
kneighbours = kneighbours.fit(X_train,y_train)

# Predictions:
y_pred = kneighbours.predict(X_test)
|
# Performance:
print('Accuracy:', accuracy_score(y_test,y_pred))
print(classification_report(y_test,y_pred))
```

## Model Validation and Evaluation Report:

Model	Classification Report	Accuracy	Confusion Matrix
Random Forest	<pre>print(classification_report(y_test,y_pred))  Accuracy: 0.8291139240506329 precision    recall   f1-score   support           0       0.91      0.74      0.82      82           2       0.77      0.92      0.84      76     accuracy                           0.83      158   macro avg       0.84      0.83      0.83      158 weighted avg       0.84      0.83      0.83      158</pre>	82%	<pre>confusion_matrix(y_test,y_pred)  array([[61, 21],        [ 6, 70]])</pre>

## 5. Model Optimization and Tuning Phase

### 5.1. Hyperparameter Tuning Documentation

Date	03-10-2024
Team ID	LTVIP2024TMID24892
Project Title	Liver Patient Identification – prediction of liver patient
Maximum Marks	10 Marks

#### Model Optimization and Tuning Phase

The Model Optimization and Tuning Phase involves refining machine learning models for peak performance. It includes optimized model code, fine-tuning hyperparameters, comparing performance metrics, and justifying the final model selection for enhanced predictive accuracy and efficiency.

#### Hyperparameter Tuning Documentation (6 Marks):

Model	Tuned Hyperparameters	Optimal Values
Random Forest	<pre>rf_classifier = RandomForestClassifier()  param_grid = [     'n_estimators': [50, 100, 200],     'criterion': ['gini', 'entropy'],     'max_depth': [None, 10, 20, 30],     'min_samples_split': [2, 5, 10],     'min_samples_leaf': [1, 2, 4], ]</pre>	<pre>accuracy = accuracy_score(y_test, y_pred) print("Optimal Hyperparameters: (best_params)") print(f"Accuracy on Test Set: {accuracy}")  Optimal Hyperparameters: {'criterion': 'entropy', 'max_depth': None, 'min_samples_leaf': 1, Accuracy on Test Set: 0.834394904585988</pre>

SVM	<pre> svm_classifier = svm.SVC()  # Define the hyperparameters and their possible values param_grid = {     'kernel': ['linear', 'rbf', 'poly'],     'C': [0.1, 1, 10],     'gamma': ['scale', 'auto'] } </pre>	<pre> accuracy = accuracy_score(y_test, y_pred) print(f'Accuracy with Best Parameters: {accuracy}')  Best Parameters: {'C': 10, 'gamma': 'scale', 'kernel': 'rbf'} Accuracy with Best Parameters: 0.77006369426752 </pre>
KNN	<pre> knn_classifier = KNeighborsClassifier() # Define the hyperparameters and their possible values param_grid = {     'n_neighbors': [3, 5, 7, 9],     'weights': ['uniform', 'distance'],     'p': [1, 2] } </pre>	<pre> accuracy = accuracy_score(y_test, y_pred) print(f'Optimal Hyperparameters: {best_params}') print(f'Accuracy on Test Set: {accuracy}')  Optimal Hyperparameters: {'n_neighbors': 3, 'p': 1, 'weights': 'distance'} Accuracy on Test Set: 0.777070636942676 </pre>

## 5.2 Performance Metrics Comparison Report (2 Marks):

Model	Baseline Metric, optimal metrics
Random Forest	<pre> print(classification_report(y_test,y_pred))  Accuracy: 0.8407643312101911       precision    recall  f1-score   support           0       0.93     0.72     0.81      76           2       0.79     0.95     0.86      81             accuracy                           0.84      157           macro avg       0.86     0.84     0.84      157       weighted avg       0.86     0.84     0.84      157 </pre>

	<pre> print(classification_report(y_test,y_pred))  Accuracy: 0.732484076433121       precision    recall  f1-score   support           0       0.81     0.58     0.68      76           2       0.69     0.88     0.77      81        accuracy                           0.73      157      macro avg       0.75     0.73     0.72      157 weighted avg       0.75     0.73     0.73      157 </pre>
SVM	<pre> print('Accuracy:', accuracy_score(y_test,y_pred)) print(classification_report(y_test,y_pred))  Accuracy: 0.7643312101910829       precision    recall  f1-score   support           0       0.87     0.61     0.71      76           2       0.71     0.91     0.80      81        accuracy                           0.76      157      macro avg       0.79     0.76     0.76      157 weighted avg       0.79     0.76     0.76      157 </pre>
KNN	

### 5.3 Final Model Selection Justification (2 Marks):

Final Model	Reasoning
Random Forest	<pre> print(classification_report(y_test,y_pred))  Accuracy: 0.8407643312101911       precision    recall  f1-score   support           0       0.93     0.72     0.81      76           2       0.79     0.95     0.86      81        accuracy                           0.84      157      macro avg       0.86     0.84     0.84      157 weighted avg       0.86     0.84     0.84      157 </pre>

```
confusion_matrix(y_test,y_pred)
45] array([[55, 21],
       [ 4, 77]])
```

4. This model has been selected because it has the high accuracy and f1-score compared to the other model mentioned above.

**NOTE: I have done other models like Gradient Boosting Classifier, AdaBoost Classifier these models will be available in the liver.ipynb file.**

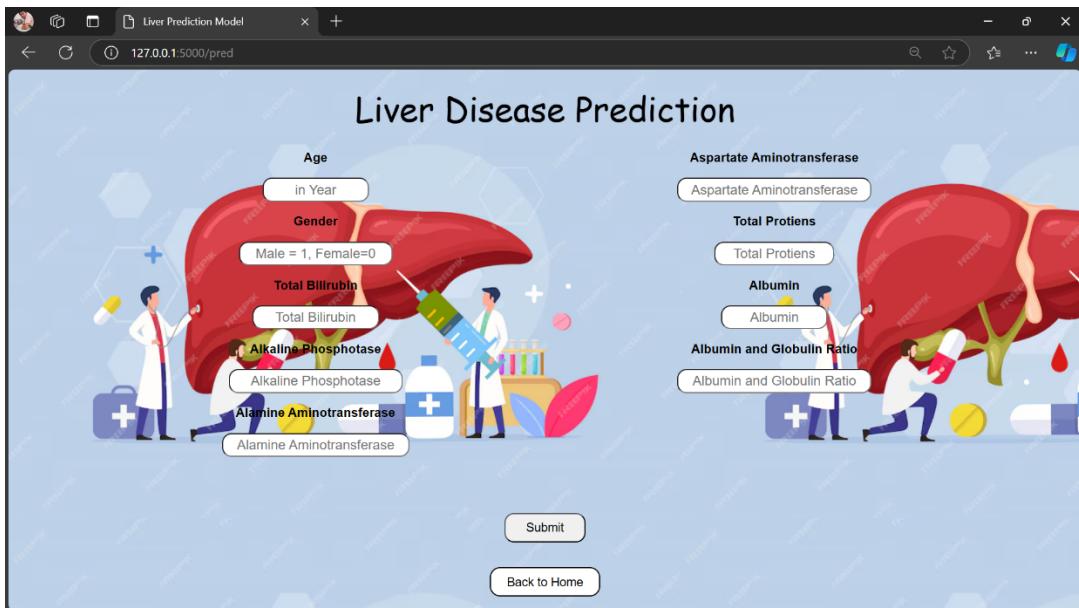

## 6.Results:

### Output screens:

#### #Home Page

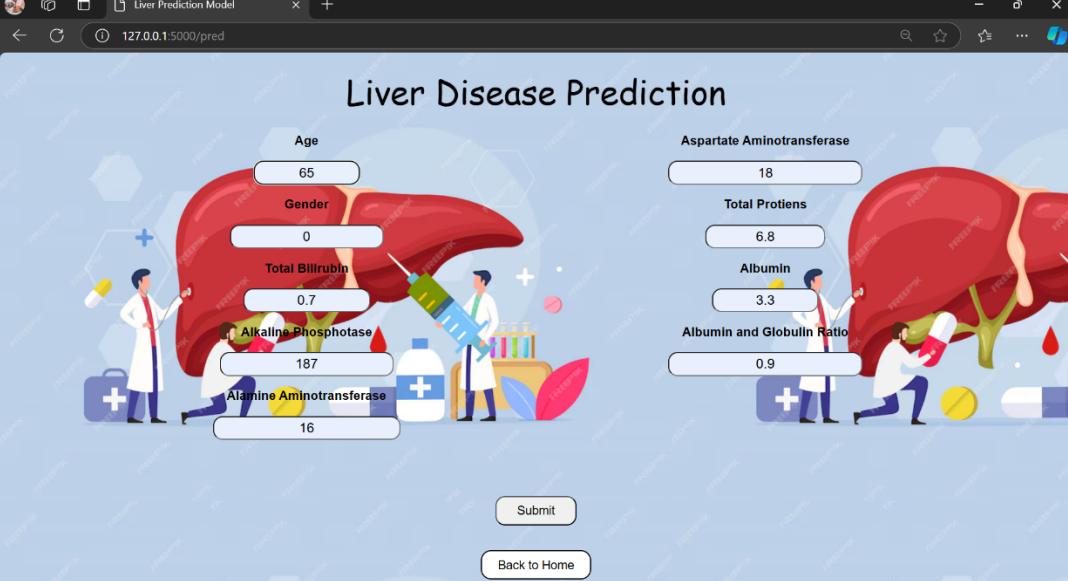

#### #Index Page

## After Execution:

#Input values (If the patient doesn't have a liver disease)

Liver Disease Prediction

Age: 65  
Gender: 0  
Total Bilirubin: 0.7  
Alkaline Phosphatase: 187  
Alanine Aminotransferase: 16  
Aspartate Aminotransferase: 18  
Total Proteins: 6.8  
Albumin: 3.3  
Albumin and Globulin Ratio: 0.9

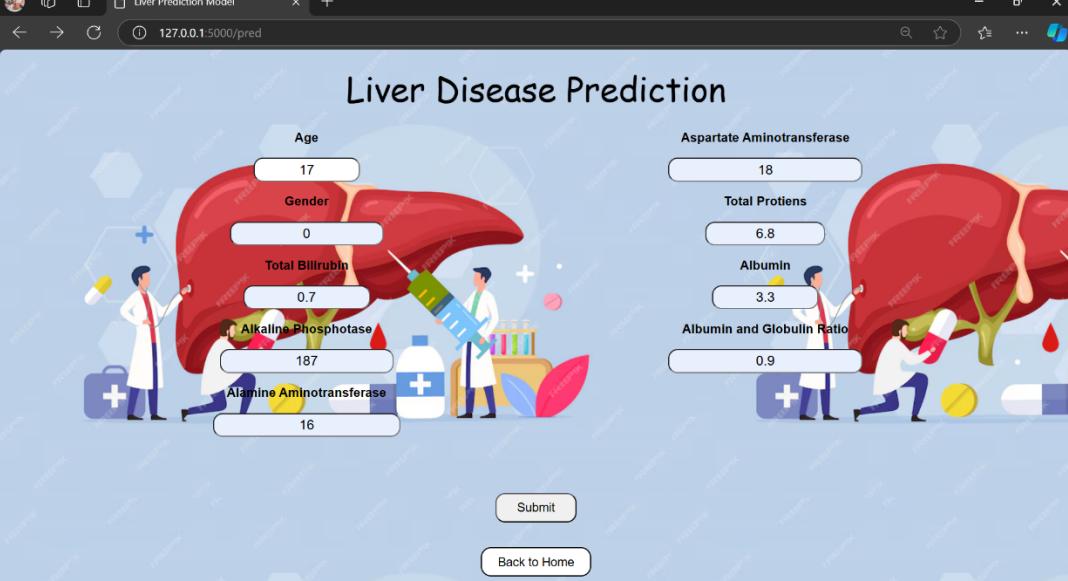

Submit  
Back to Home

This screenshot shows the input interface for a liver disease prediction model. It features a central illustration of a liver surrounded by medical icons like doctors, pills, and test tubes. On the left, input fields show age (65), gender (0), total bilirubin (0.7), alkaline phosphatase (187), Alanine Aminotransferase (16), Aspartate Aminotransferase (18), total proteins (6.8), albumin (3.3), and albumin and globulin ratio (0.9). On the right, there are additional input fields for gender (0) and albumin (3.3). At the bottom are 'Submit' and 'Back to Home' buttons.

#Output (If the patient doesn't have a liver disease)

#Input values (If the patient have liver disease)

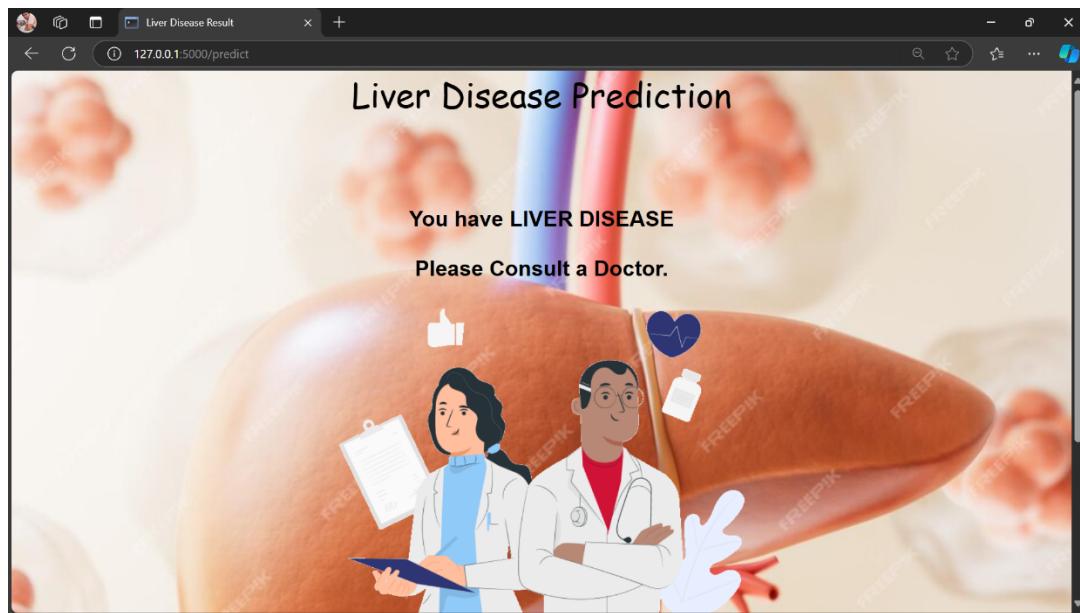

Liver Disease Prediction

Age: 17  
Gender: 0  
Total Bilirubin: 0.7  
Alkaline Phosphatase: 187  
Alanine Aminotransferase: 16  
Aspartate Aminotransferase: 18  
Total Proteins: 6.8  
Albumin: 3.3  
Albumin and Globulin Ratio: 0.9

Submit  
Back to Home

This form allows users to input various liver function test results to predict if a patient has liver disease. It features a central liver icon with medical icons and a background of medical professionals.

#Output (Patient have a liver disease)

#pyNoteBook Output Screenings:

### RandomForestClassifier

```
# RandomForestClassifier:  
from sklearn.ensemble import RandomForestClassifier  
RandomForest = RandomForestClassifier()  
RandomForest = RandomForest.fit(X_train,y_train)  
  
# Predictions:  
y_pred = RandomForest.predict(X_test)  
  
# Performance:  
print('Accuracy:', accuracy_score(y_test,y_pred))  
print(classification_report(y_test,y_pred))
```

```
Accuracy: 0.8407643312101911  
precision    recall   f1-score   support  
          0       0.90      0.75      0.82       76  
          2       0.80      0.93      0.86       81  
  
accuracy          0.84       157  
macro avg       0.85      0.84      0.84       157  
weighted avg     0.85      0.84      0.84       157
```

## Support vector Machine

```
[ ] from sklearn import svm
supportvector = svm.SVC()
supportvector = supportvector.fit(X_train,y_train)

# Predictions:
y_pred = supportvector.predict(X_test)

# Performance:
print('Accuracy:', accuracy_score(y_test,y_pred))
print(classification_report(y_test,y_pred))
```

```
→ Accuracy: 0.6942675159235668
      precision    recall   f1-score   support
          0       0.75     0.55     0.64      76
          2       0.66     0.83     0.74      81

accuracy                           0.69      157
macro avg                      0.71     0.69     0.69      157
weighted avg                     0.71     0.69     0.69      157
```

## SMOTE Technique

```
[ ] # SMOTE Technique:
from imblearn.combine import SMOTETomek
num_bins = 3
y = pd.cut(y, bins=num_bins, labels=False)

smote = SMOTETomek()
X_smote, y_smote = smote.fit_resample(X, y)

# Counting before and after SMOTE:
from collections import Counter
print('Before SMOTE : ', Counter(y))
print('After SMOTE  : ', Counter(y_smote))

→ Before SMOTE : Counter({0: 416, 2: 167})
After SMOTE  : Counter({0: 391, 2: 391})

[ ] # Train Test Split:
from sklearn.model_selection import train_test_split
X_train,X_test,y_train,y_test = train_test_split(X_smote,y_smote, test_size=0.2, random_state=42)
```

## KNN

```
[ ] from sklearn.neighbors import KNeighborsClassifier  
kneighbours = KNeighborsClassifier()  
kneighbours = kneighbours.fit(X_train,y_train)  
  
# Predictions:  
y_pred = kneighbours.predict(X_test)  
  
# Performance:  
print('Accuracy:', accuracy_score(y_test,y_pred))  
print(classification_report(y_test,y_pred))
```

```
→ Accuracy: 0.7452229299363057  
precision recall f1-score support

```

## 7. Advantages & Disadvantages

- **Advantages:**

- **Early Intervention:** By identifying patients at risk for liver diseases early, healthcare providers can initiate treatments sooner, potentially preventing disease progression and complications.
- **Personalized Care:** The system can analyse individual patient data to provide tailored management plans based on specific risk factors, leading to more effective treatment strategies.
- **Data-Driven Decisions:** Access to comprehensive data allows healthcare professionals to make informed decisions, improving diagnostic accuracy and treatment outcomes.

- **Resource Optimization:** By streamlining the identification process, healthcare facilities can optimize their resources, ensuring that patients who need immediate care receive it promptly.
- **Enhanced Monitoring:** The system can facilitate ongoing monitoring of patients with liver conditions, allowing for timely adjustments to treatment plans based on their changing health status.
- **Increased Awareness:** The project can help raise awareness about liver health among both patients and healthcare providers, promoting preventive measures and lifestyle changes that can reduce the risk of liver diseases.
- **Research Opportunities:** The data collected through the system can contribute to research on liver diseases, helping to identify trends, risk factors, and treatment efficacy.

➤ **Disadvantages:**

- **High Implementation Costs:** Setting up a comprehensive identification system can involve significant financial investment. This includes costs for technology, software, training staff, and maintaining the system. Smaller healthcare facilities may struggle to afford these expenses.
- **Privacy Concerns:** Handling sensitive patient data raises privacy issues. There is a risk of data breaches or unauthorized access, which could compromise patient confidentiality and trust in the healthcare system.
- **Over-Reliance on the System:** If healthcare providers depend too heavily on the identification system, they might overlook clinical signs or symptoms that are not captured by the system. This could lead to missed diagnoses or inadequate patient care.
- **Technical Issues:** Like any technology, the system may experience technical problems, such as software bugs or system outages. These issues can disrupt patient identification processes and delay care.

- **Limited Access:** Patients in rural or underserved areas may not have access to the necessary technology or infrastructure to utilize the system effectively. This can create disparities in care and limit the system's overall effectiveness.
- **Resistance to Change:** Some healthcare providers may be resistant to adopting a new system, especially if they are accustomed to traditional methods. This resistance can hinder the successful implementation and utilization of the identification system.

## 8. Conclusion:

- In conclusion, while a liver patient identification system offers several advantages like early detection and personalized treatment, it also comes with notable disadvantages such as high implementation costs and privacy concerns.
- Balancing these pros and cons is essential for healthcare providers to ensure that the system enhances patient care without compromising safety or accessibility.

## 9. Future Scope:

The future scope of a liver patient identification system is quite promising, with several key areas for potential growth and development:

- **Integration with Artificial Intelligence:** Future systems could leverage AI and machine learning to enhance diagnostic accuracy. By analysing large datasets, AI can identify patterns and predict liver disease progression, leading to more effective early interventions.
- **Telemedicine and Remote Monitoring:** With the rise of telehealth, integrating the identification system with remote monitoring tools can allow healthcare providers to track patient health in real-time. This can lead to timely adjustments in treatment plans and improved patient engagement.

- **Personalized Medicine:** As research in genomics and personalized medicine advances, the identification system could incorporate genetic data to provide tailored treatment options. This would enable healthcare providers to understand how individual patients may respond to specific therapies.
- **Improved Data Analytics:** Future systems may utilize advanced data analytics to provide insights into patient populations, helping healthcare providers identify trends in liver disease and optimize resource allocation. This can inform public health strategies and preventive measures.
- **Enhanced Patient Education:** The system can evolve to include educational components that inform patients about liver health, risk factors, and lifestyle changes. Empowering patients with knowledge can lead to better health outcomes and proactive management of their conditions.
- **Interoperability with Other Health Systems:** Ensuring that the liver patient identification system can communicate seamlessly with other healthcare systems will be crucial. This interoperability can facilitate comprehensive patient care by allowing providers to access a patient's full medical history.
- **Focus on Preventive Care:** Future developments may emphasize preventive care by identifying at-risk populations and implementing screening programs. This proactive approach can help reduce the incidence of liver diseases through early detection and lifestyle modifications.
- **Regulatory and Ethical Frameworks:** As technology advances, establishing robust regulatory and ethical frameworks will be essential to address privacy concerns and ensure patient safety. This will help build trust in the system and encourage wider adoption.
